

# Package: easyNCDF (via r-universe)

August 25, 2024

**Title** Tools to Easily Read/Write NetCDF Files into/from  
Multidimensional R Arrays

**Version** 0.1.2

**Description** Set of wrappers for the 'ncdf4' package to simplify and  
extend its reading/writing capabilities into/from  
multidimensional R arrays.

**Depends** R (>= 3.2.0)

**Imports** ncdf4, abind

**License** GPL-3

**URL** <https://earth.bsc.es/gitlab/es/easyNCDF>

**BugReports** <https://earth.bsc.es/gitlab/es/easyNCDF/-/issues>

**SystemRequirements** netcdf development libraries

**RoxygenNote** 7.2.0

**Encoding** UTF-8

**Config/testthat/edition** 3

**NeedsCompilation** no

**Author** BSC-CNS [aut, cph], Nicolau Manubens [aut], Nuria Perez-Zanon  
[ctb] (<<https://orcid.org/0000-0001-8568-3071>>), An-Chi Ho  
[cre]

**Maintainer** An-Chi Ho <[an.ho@bsc.es](mailto:an.ho@bsc.es)>

**Date/Publication** 2023-06-02 12:20:02 UTC

**Repository** <https://anchiho.r-universe.dev>

**RemoteUrl** <https://github.com/cran/easyNCDF>

**RemoteRef** HEAD

**RemoteSha** c11f4e00c5bae8cfff248aa5112221aa032b21f4

ArrayToNc	<i>Save multidimensional R arrays into NetCDF files</i>
-----------	---

---

## Description

This function takes as input one or a list of multidimensional R arrays and stores them in a NetCDF file, using the `ncdf4` package. The full path and name of the resulting file must be specified. Metadata can be attached to the arrays and propagated into the NetCDF file in 3 possible ways:

- Via the list names if a list of arrays is provided: Each name in the input list, corresponding to one multidimensional array, will be interpreted as the name of the variable it contains.

E.g:

```
ArrayToNc(arrays = list(temperature = array(1:9, c(3, 3))), file_path = 'example.nc')
```

- Via the dimension names of each provided array: The dimension names of each of the provided arrays will be interpreted as names for the dimensions of the NetCDF files. Read further for special dimension names that will trigger special behaviours, such as 'time' and 'var'.

E.g:

```
temperature <- array(rnorm(100 * 50 * 10), dim = c(100, 50, 10)) names(dim(temperature))
<- c('longitude', 'latitude', 'time') ArrayToNc(list(temperature = temperature),
file_path = 'example.nc')
```

- Via the attribute 'variables' of each provided array: The arrays can be provided with metadata in an attribute named 'variables', which is expected to be a named list of named lists, where the names of the container list are the names of the variables present in the provided array, and where each sub-list contains metadata for each of the variables. The attribute names and values supported in the sub-lists must follow the same format the package `ncdf4` uses to represent the NetCDF file headers.

E.g:

```
a <- array(1:400, dim = c(5, 10, 4, 2)) metadata <- list( tos = list(addOffset = 100,
scaleFact = 10, dim = list(list(name = 'time', unlim = FALSE))), tas = list(addOffset
= 100, scaleFact = 10, dim = list(list(name = 'time', unlim = FALSE))) ) attr(a, 'variables')
<- metadata names(dim(a)) <- c('lat', 'lon', 'time', 'var') ArrayToNc(a, 'tmp.nc')
```

The special dimension names are 'var'/'variable' and 'time'.

If a dimension is named 'var' or 'variable', ArrayToNc will interpret each array entry along such dimension corresponds to a separate new variable, hence will create a new variable inside the NetCDF file and will use it to store all the data in the provided array for the corresponding entry along the 'var'/'variable' dimension.

If a dimension is named 'time', by default it will be interpreted and built as an unlimited dimension. The 'time' dimension must be the last dimension of the array (the right-most). If a 'var'/'variable' dimension is present, the 'time' dimension can be also placed on its left (i.e. the one before the last dimension). The default behaviour of creating the 'time' as unlimited dimension can be disabled by setting manually the attribute `unlim = FALSE`, as shown in the previous example.

`a2nc` is an alias of `ArrayToNc`.

### Usage

```
ArrayToNc(arrays, file_path)
```

```
a2nc(arrays, file_path)
```

### Arguments

<code>arrays</code>	One or a list of multidimensional data arrays. The list can be provided with names, which will be interpreted as variable names. The arrays can be provided with dimension names. The arrays can be provided with metadata in the attribute 'variables' (read section Description for details).
<code>file_path</code>	Path and name of the NetCDF file to be created.

### Value

This function returns `NULL`.

### Author(s)

N. Manubens <nicolau.manubens@bsc.es>

### Examples

```
## Not run:
# Minimal use case
ArrayToNc(array(1:9, c(3, 3)), 'tmp.nc')
# Works with arrays of any number of dimensions
ArrayToNc(array(1:27, c(3, 3, 3)), 'tmp.nc')

# Arrays can also be provided in [named] lists
ArrayToNc(list(tos = array(1:27, c(3, 3, 3))), 'tmp.nc')

# Or with dimension names
# 'var' dimension name will generate multiple variables in the
# resulting NetCDF file
a <- array(1:27, dim = c(3, 3, 3))
```

```

names(dim(a)) <- c('lon', 'lat', 'var')
ArrayToNc(a, 'tmp.nc')

# 'variable' as dimension name will do the same
a <- array(1:27, dim = c(3, 3, 3))
names(dim(a)) <- c('lon', 'lat', 'variable')
ArrayToNc(a, 'tmp.nc')

# The 'time' dimension will be built as unlimited dimension, by default
a <- array(1:1600, dim = c(10, 20, 4, 2))
names(dim(a)) <- c('lat', 'lon', 'time', 'var')
ArrayToNc(a, 'tmp.nc')

# The dimension 'var'/'variable' can be in any position and can have any
# length.
a <- array(1:1600, dim = c(10, 20, 4, 2))
names(dim(a)) <- c('lat', 'var', 'lon', 'time')
ArrayToNc(a, 'tmp.nc')

# Multiple arrays can be provided in a list
a <- array(1:400, dim = c(5, 10, 4, 2))
names(dim(a)) <- c('lat', 'lon', 'time', 'var')
ArrayToNc(list(a, a), 'tmp.nc')

# If no dimension names are given to an array, new names will be automatically
# generated
a <- array(1:400, dim = c(5, 10, 4, 2))
b <- array(1:400, dim = c(5, 11, 4, 2))
names(dim(a)) <- c('lat', 'lon', 'time', 'var')
ArrayToNc(list(a, b), 'tmp.nc')

# Metadata can be provided for each variable in each array, via the
# attribute 'variables'. In this example the metadata is empty.
a <- array(1:400, dim = c(5, 10, 4, 2))
metadata <- list(
  tos = list(),
  tas = list())
attr(a, 'variables') <- metadata
names(dim(a)) <- c('lat', 'lon', 'time', 'var')
ArrayToNc(a, 'tmp.nc')

# Variable names can be manually specified
a <- array(1:400, dim = c(5, 10, 4, 2))
metadata <- list(
  tos = list(name = 'name1'),
  tas = list(name = 'name2'))
attr(a, 'variables') <- metadata
names(dim(a)) <- c('lat', 'lon', 'time', 'var')
ArrayToNc(a, 'tmp.nc')

# Units can be specified
a <- array(1:400, dim = c(5, 10, 4, 2))
metadata <- list(
  tos = list(units = 'K'),

```

```

        tas = list(units = 'K'))
attr(a, 'variables') <- metadata
names(dim(a)) <- c('lat', 'lon', 'time', 'var')
ArrayToNc(a, 'tmp.nc')

# addOffset and scaleFactor can be specified
a <- array(1:400, dim = c(5, 10, 4, 2))
metadata <- list(
  tos = list(addOffset = 100,
             scaleFactor = 10),
  tas = list(addOffset = 100,
             scaleFactor = 10))
attr(a, 'variables') <- metadata
names(dim(a)) <- c('lat', 'lon', 'time', 'var')
ArrayToNc(a, 'tmp.nc')

# Global attributes can be specified
a <- array(rnorm(10), dim = c(a = 5, b = 2))
attrs <- list(variables =
  list(tas = list(var_attr_1 = 'test_1_var',
                 var_attr_2 = 2)),
  global_attrs = list(global_attr_name_1 = 'test_1_global',
                     global_attr_name_2 = 2))
attributes(a) <- c(attributes(a), attrs)
ArrayToNc(a, 'tmp.nc')

# Unlimited dimensions can be manually created
a <- array(1:400, dim = c(5, 10, 4, 2))
metadata <- list(
  tos = list(addOffset = 100,
             scaleFactor = 10,
             dim = list(list(name = 'unlimited',
                             unlim = TRUE))),
  tas = list(addOffset = 100,
             scaleFactor = 10,
             dim = list(list(name = 'unlimited',
                             unlim = TRUE))))
attr(a, 'variables') <- metadata
names(dim(a)) <- c('lat', 'lon', 'unlimited', 'var')
ArrayToNc(a, 'tmp.nc')

# A 'time' dimension can be built without it necessarily being unlimited
a <- array(1:400, dim = c(5, 10, 4, 2))
metadata <- list(
  tos = list(addOffset = 100,
             scaleFactor = 10,
             dim = list(list(name = 'time',
                             unlim = FALSE))),
  tas = list(addOffset = 100,
             scaleFactor = 10,
             dim = list(list(name = 'time',
                             unlim = FALSE))))
attr(a, 'variables') <- metadata

```

```
names(dim(a)) <- c('lat', 'lon', 'time', 'var')
ArrayToNc(a, 'tmp.nc')

tos <- array(1:400, dim = c(5, 10, 4))
metadata <- list(tos = list(units = 'K'))
attr(tos, 'variables') <- metadata
names(dim(tos)) <- c('lat', 'lon', 'time')
lon <- seq(0, 360 - 360 / 10, length.out = 10)
dim(lon) <- length(lon)
metadata <- list(lon = list(units = 'degrees_east'))
attr(lon, 'variables') <- metadata
names(dim(lon)) <- 'lon'
lat <- seq(-90, 90, length.out = 5)
dim(lat) <- length(lat)
metadata <- list(lat = list(units = 'degrees_north'))
attr(lat, 'variables') <- metadata
names(dim(lat)) <- 'lat'
ArrayToNc(list(tos, lon, lat), 'tmp.nc')

## End(Not run)
```

---

NcClose

*Close a NEtCDF File*

---

### **Description**

Close a ncdf4 open connection to a file.

### **Usage**

```
NcClose(file_object)
```

### **Arguments**

`file_object`      NetCDF object as returned by `ncdf4::nc_open`.

### **Value**

The result of `ncdf4::nc_close`.

### **Author(s)**

N. Manubens <nicolau.manubens@bsc.es>

**Examples**

```
# Create an array from R
file_path <- tempfile(fileext = '.nc')
a <- array(1:9, dim = c(member = 3, time = 3))
# Store into a NetCDF twice, as two different variables
ArrayToNc(list(var_1 = a, var_2 = a + 1), file_path)
# Read the dimensions and variables in the created file
fnc <- NcOpen(file_path)
fnc_dims <- NcReadDims(fnc)
var_names <- NcReadVarNames(fnc)
# Read the two variables from the file into an R array
a_from_file <- NcToArray(fnc, vars_to_read = var_names)
NcClose(fnc)
# Check the obtained array matches the original array
print(a)
print(a_from_file[1, , ])
```

---

NcOpen

*Open a NetCDF File*

---

**Description**

Silently opens a NetCDF file with `ncdf4::nc_open`. Returns NULL on failure.

**Usage**

```
NcOpen(file_path)
```

**Arguments**

`file_path`      Character string with the path to the file to be opened.

**Value**

A NetCDF object as returned by `ncdf4::nc_open` or NULL on failure.

**Author(s)**

N. Manubens <nicolau.manubens@bsc.es>

**Examples**

```
# Create an array from R
file_path <- tempfile(fileext = '.nc')
a <- array(1:9, dim = c(member = 3, time = 3))
# Store into a NetCDF twice, as two different variables
ArrayToNc(list(var_1 = a, var_2 = a + 1), file_path)
# Read the dimensions and variables in the created file
fnc <- NcOpen(file_path)
```

```
fnc_dims <- NcReadDims(fnc)
var_names <- NcReadVarNames(fnc)
# Read the two variables from the file into an R array
a_from_file <- NcToArray(fnc, vars_to_read = var_names)
NcClose(fnc)
# Check the obtained array matches the original array
print(a)
print(a_from_file[1, , ])
```

---

NcReadDims

*Read Dimensions of a NetCDF File*

---

### Description

Reads the dimension names and sizes of a set of variables in a NetCDF file, using the package `ncdf4`. The different variables in the file are considered to be stored along a dimension called 'var', so reading the dimensions of a variable 'foo' with dimensions 'lat' and 'lon' would result in a vector with the format `c('var' = 1, 'lat' = n_lats, 'lon' = n_lons)`.

### Usage

```
NcReadDims(file_to_read, var_names = NULL)
```

### Arguments

<code>file_to_read</code>	Path to the file to be read or a NetCDF object as returned by <code>easyNCDF::NcOpen</code> or <code>ncdf4::nc_open</code> .
<code>var_names</code>	Vector of character strings with the names of the variables which to read the dimensions for. If multiple variables are requested, their dimensions will be merged and returned in a single vector.

### Author(s)

N. Manubens <nicolau.manubens@bsc.es>

### Examples

```
# Create an array from R
file_path <- tempfile(fileext = '.nc')
a <- array(1:9, dim = c(member = 3, time = 3))
# Store into a NetCDF twice, as two different variables
ArrayToNc(list(var_1 = a, var_2 = a + 1), file_path)
# Read the dimensions and variables in the created file
fnc <- NcOpen(file_path)
fnc_dims <- NcReadDims(fnc)
var_names <- NcReadVarNames(fnc)
# Read the two variables from the file into an R array
a_from_file <- NcToArray(fnc, vars_to_read = var_names)
```

```
NcClose(fnc)
# Check the obtained array matches the original array
print(a)
print(a_from_file[1, , ])
```

---

NcReadVarNames	<i>Read Names of Variables in a NetCDF File</i>
----------------	---

---

### Description

Reads the names of the variables in a NetCDF file and returns them as a vector of character strings.

### Usage

```
NcReadVarNames(file_to_read)
```

### Arguments

`file_to_read` Path to the file to be read or a NetCDF object as returned by `easyNCDF::NcOpen` or `ncdf4::nc_open`.

### Value

Vector of character strings with the names of the variables in the NetCDF file.

### Author(s)

N. Manubens <nicolau.manubens@bsc.es>

### Examples

```
# Create an array from R
file_path <- tempfile(fileext = '.nc')
a <- array(1:9, dim = c(member = 3, time = 3))
# Store into a NetCDF twice, as two different variables
ArrayToNc(list(var_1 = a, var_2 = a + 1), file_path)
# Read the dimensions and variables in the created file
fnc <- NcOpen(file_path)
fnc_dims <- NcReadDims(fnc)
var_names <- NcReadVarNames(fnc)
# Read the two variables from the file into an R array
a_from_file <- NcToArray(fnc, vars_to_read = var_names)
NcClose(fnc)
# Check the obtained array matches the original array
print(a)
print(a_from_file[1, , ])
```

NcToArray

*Read Names of Variables in a NetCDF File***Description**

Reads the names of the variables in a NetCDF file and returns them as a vector of character strings.

**Usage**

```
NcToArray(
  file_to_read,
  dim_indices = NULL,
  vars_to_read = NULL,
  drop_var_dim = FALSE,
  unlist = TRUE,
  expect_all_indices = FALSE,
  allow_out_of_range = TRUE
)
```

**Arguments**

<code>file_to_read</code>	Path to the file to be read or a NetCDF object as returned by <code>easyNCDF::NcOpen</code> or <code>ncdf4::nc_open</code> .
<code>dim_indices</code>	Named list with numeric vectors of indices to take for each dimension. The names should correspond to the dimension names which to take the indices for. Non-consecutive indices can be specified. If <code>expect_all_indices = FALSE</code> (default), it is not mandatory to specify the indices for all (or even any of) the dimensions. In that case all the indices along such dimensions will be read in. If <code>expect_all_indices = TRUE</code> , then indices for all the dimensions have to be specified for the function to return a data array. In that case, NA can be used to request all indices for a dimension if desired.

Since this function considers the variables in a NetCDF file are stored along a 'var' dimension, indices for the (actually non-existing) 'var'/variable' dimension can be specified. They can be specified in 3 ways:

- A vector of numeric indices: e.g. `list(var = c(1, 3, 5))` to take the 1st, 3rd and 5th found variables.
- A vector of character strings with variable names: e.g. `list(var = c('foo', 'bar'))`.
- A list of vectors with numeric indices or character strings: e.g. `list(var = list(c(1, 3, 'foo'), c(2, 'bar')))`

Vectors with combined numeric indices and character strings are accepted.

Whereas the first two options will return a single extended array with the merged variables, the second option will return a list with an array for each requested variable.

<code>vars_to_read</code>	This parameter is a shortcut to (and has less priority than) specifying the requested variable names via <code>dim_indices = list(var = ...)</code> . It is useful when all the indices for all the requested variables have to be taken, so the parameter <code>dim_indices</code> can be skipped, but still only a specific variable or set of variables have to be taken. Check the documentation for the parameter <code>dim_indices</code> to see the three possible ways to specify this parameter.
<code>drop_var_dim</code>	Whether to drop the 'var' dimension this function assumes (read description). If multiple variables are requested in a vector and <code>unlist = TRUE</code> , the drop won't be performed (not possible).
<code>unlist</code>	Whether to merge the resulting array variables into a single array if possible (default) or not. Otherwise a list with as many arrays as requested variables is returned.
<code>expect_all_indices</code>	Whether the function should stop if indices are not provided for all the dimensions of any of the requested variables ( <code>TRUE</code> ) rather than assuming that all the indices are requested for the unspecified dimensions ( <code>FALSE</code> ). By default the later is done ( <code>FALSE</code> ).
<code>allow_out_of_range</code>	Whether to allow indices out of range (simply disregard them) or to stop if indices out of range are found.

**Value**

Vector of character strings with the names of the variables in the NetCDF file.

**Author(s)**

N. Manubens, <nicolau.manubens@bsc.es>

**Examples**

```
# Create an array from R
file_path <- tempfile(fileext = '.nc')
a <- array(1:9, dim = c(member = 3, time = 3))
# Store into a NetCDF twice, as two different variables
ArrayToNc(list(var_1 = a, var_2 = a + 1), file_path)
# Read the dimensions and variables in the created file
fnc <- NcOpen(file_path)
fnc_dims <- NcReadDims(fnc)
var_names <- NcReadVarNames(fnc)
# Read the two variables from the file into an R array
a_from_file <- NcToArray(fnc, vars_to_read = var_names)
NcClose(fnc)
# Check the obtained array matches the original array
print(a)
print(a_from_file[1, , ])
```
